

# CS 547: Foundation of Computer Security

S. Tripathy  
IIT Patna

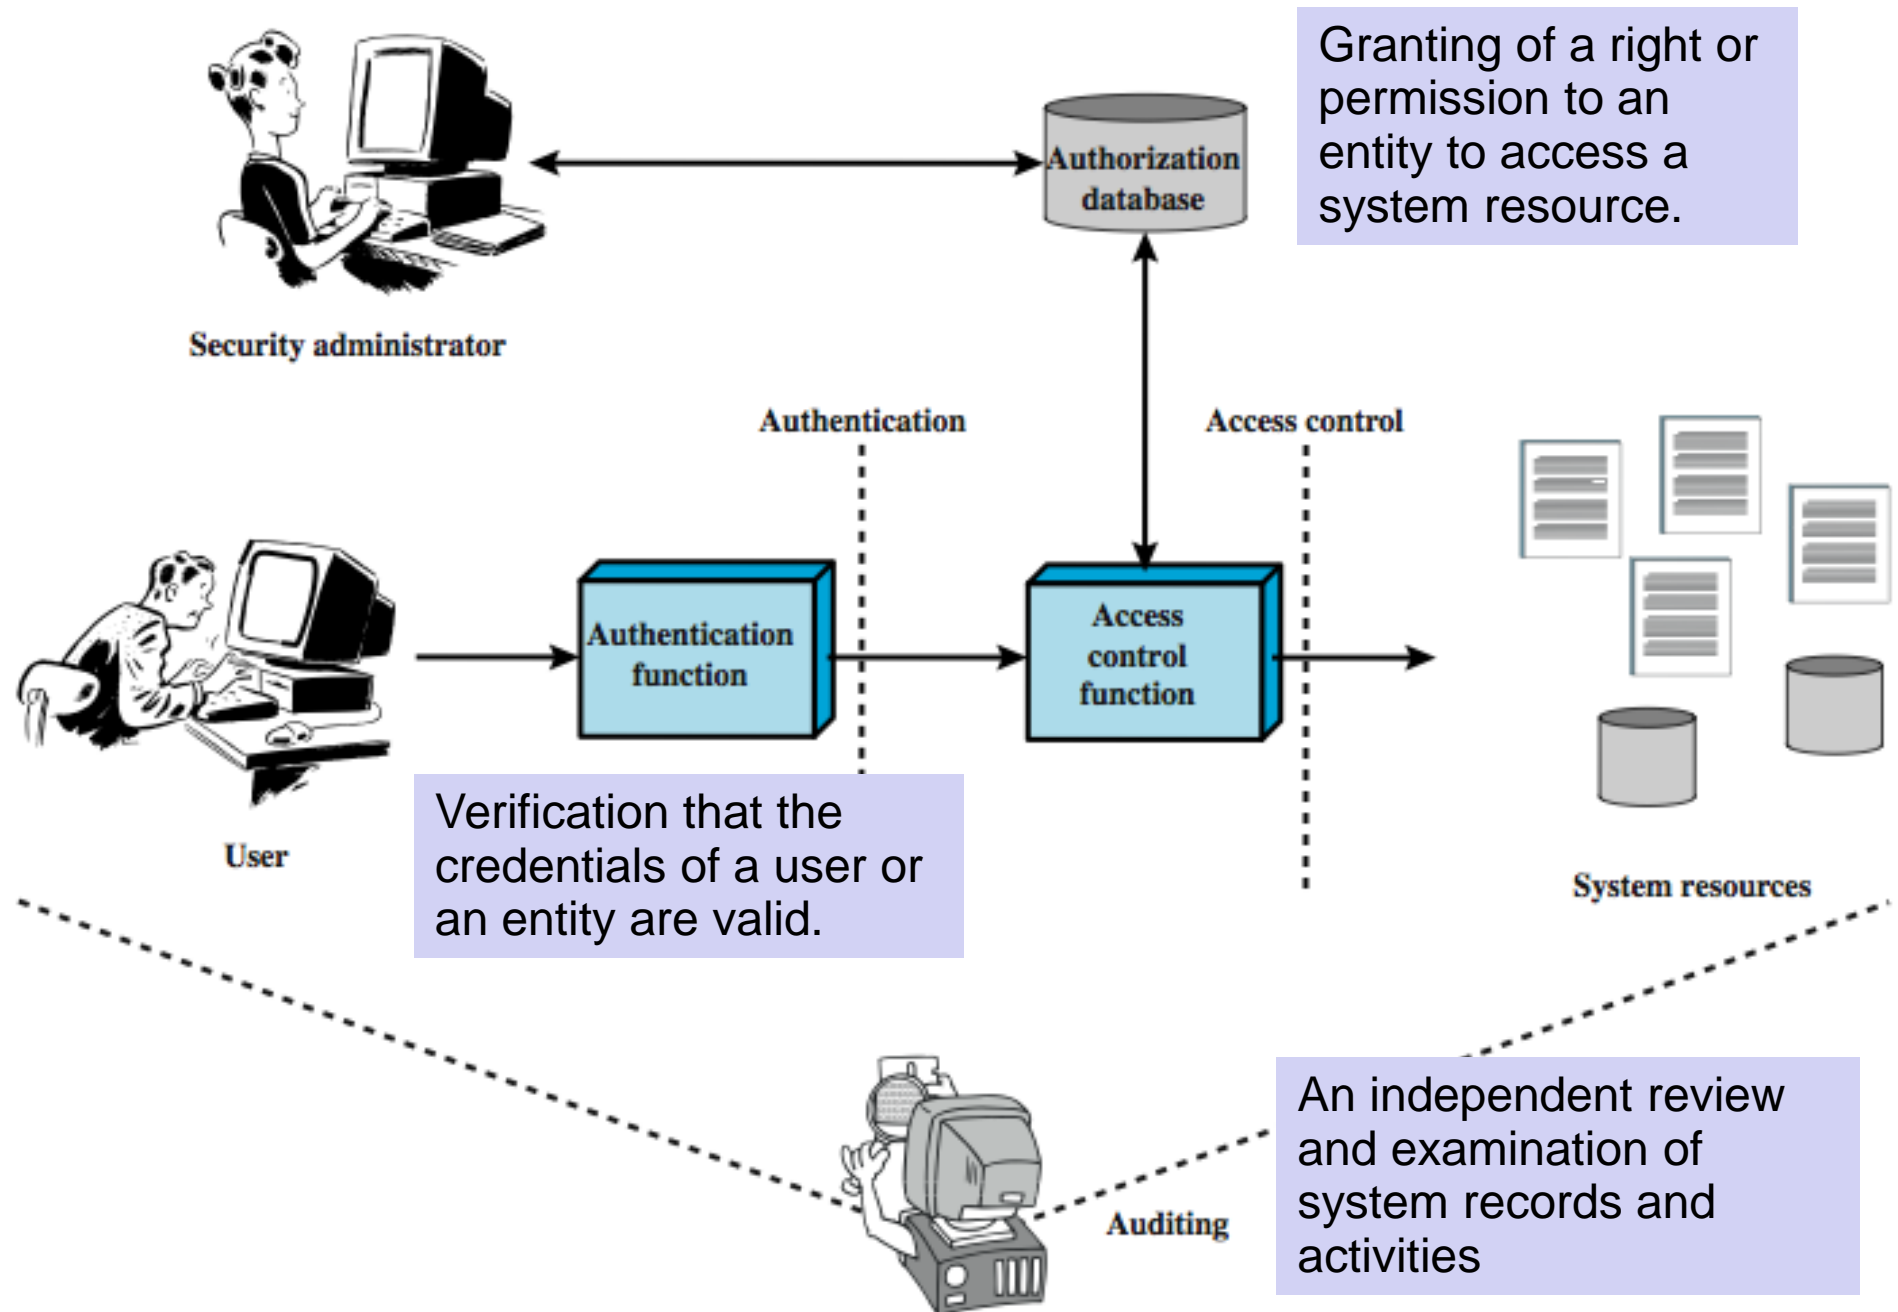

# *Previous Class*

- Authentication
  - Password
    - Linux and Windows machines
  - Remote Authentication

# Present class

- Access Control
  - Access Control Matrix
  - Access Control Lists vs. Capabilities
  - Discretionary Access Control
    - Unix File Access Control
  - Mandatory Access Control
  - Role-Based Access Control

# Access Control Principles

# Access Control Basic Elements

**subject**  
entity capable  
of accessing  
objects

- ⑩ concept equates with that of process
- ⑩ typically held accountable for the actions they initiate
- ⑩ often have three classes: owner, group, world

**object**  
resource to  
which access is  
controlled

- ⑩ entity used to contain and/or receive information
- ⑩ protection depends on the environment in which access control operates

**access right:**  
the way in  
which a  
subject may  
access an  
object

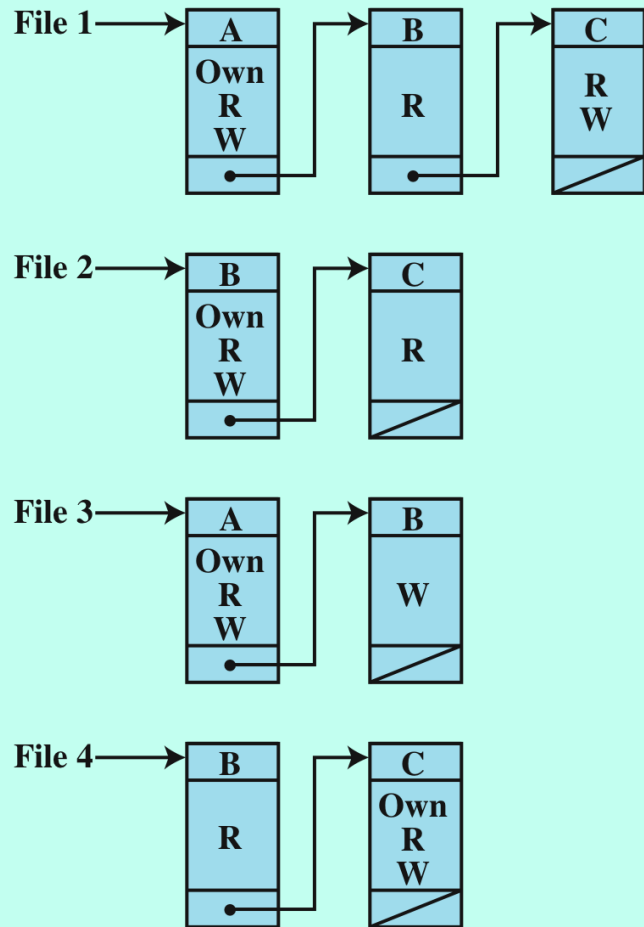

- ⑩ e.g. read, write, execute, delete, create, search

# Access Matrix

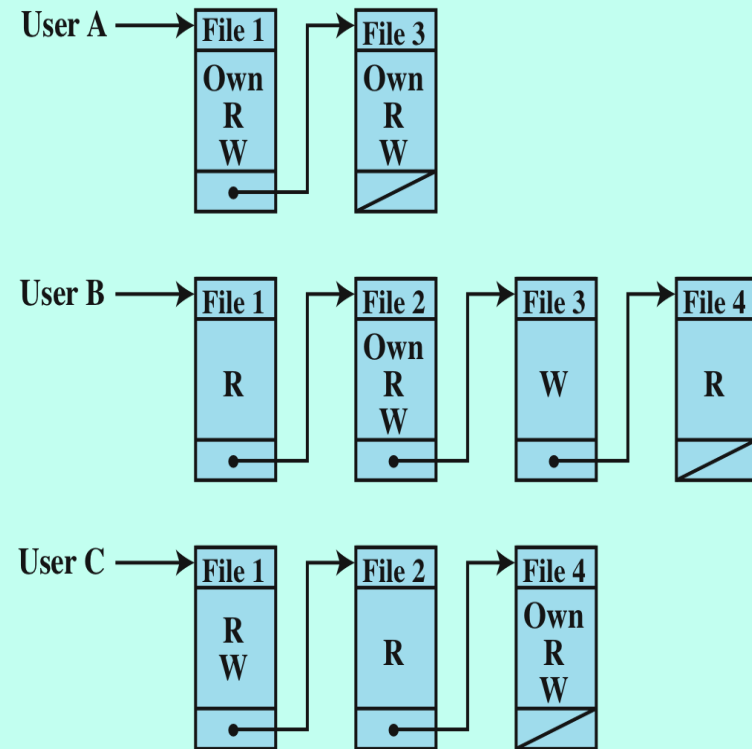

|          |        | OBJECTS              |                      |                      |                      |
|----------|--------|----------------------|----------------------|----------------------|----------------------|
|          |        | File 1               | File 2               | File 3               | File 4               |
| SUBJECTS | User A | Own<br>Read<br>Write |                      | Own<br>Read<br>Write |                      |
|          | User B | Read                 | Own<br>Read<br>Write | Write                | Read                 |
|          | User C | Read<br>Write        | Read                 |                      | Own<br>Read<br>Write |

(a) Access matrix

# Example of Access Control Structures

(b) Access control lists for files of part (a)

(c) Capability lists for files of part (a)

# Authorization Table

| Subject | Access Mode | Object |
|---------|-------------|--------|
| A       | Own         | File 1 |
| A       | Read        | File 1 |
| A       | Write       | File 1 |
| A       | Own         | File 3 |
| A       | Read        | File 3 |
| A       | Write       | File 3 |
| B       | Read        | File 1 |
| B       | Own         | File 2 |
| B       | Read        | File 2 |
| B       | Write       | File 2 |
| B       | Write       | File 3 |
| B       | Read        | File 4 |
| C       | Read        | File 1 |
| C       | Write       | File 1 |
| C       | Read        | File 2 |
| C       | Own         | File 4 |
| C       | Read        | File 4 |
| C       | Write       | File 4 |

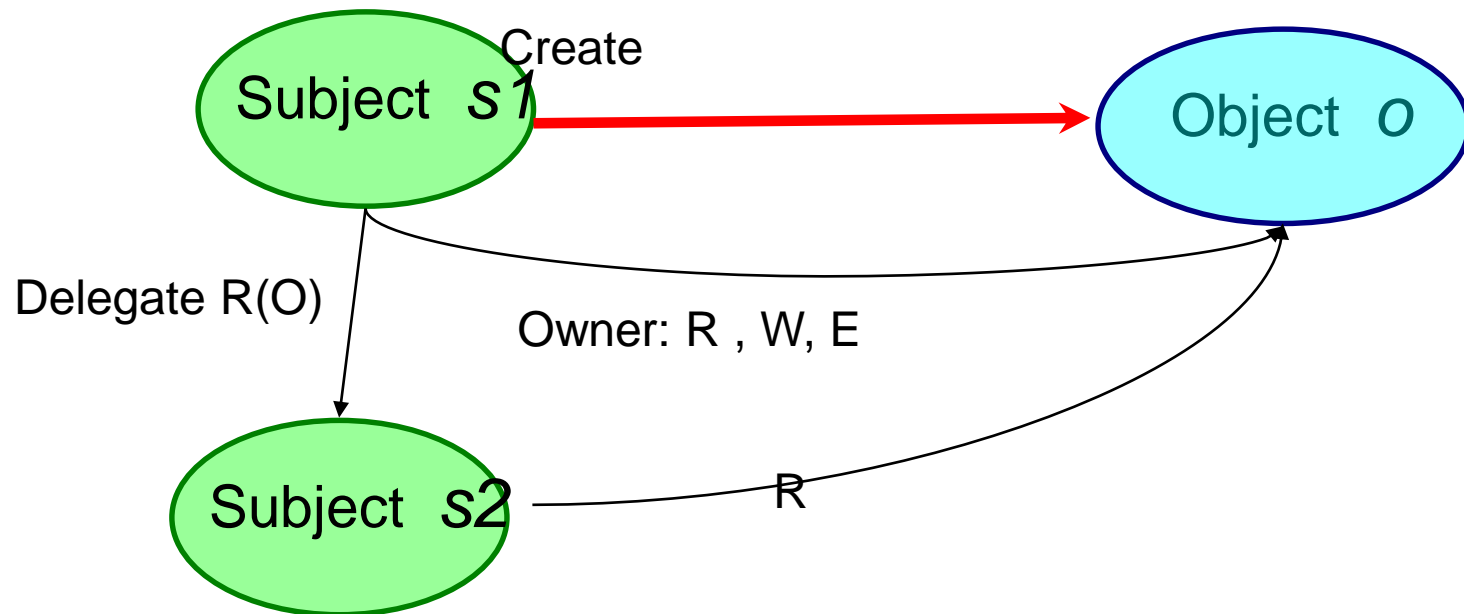

# Extended Access Control Matrix

|          |                | OBJECTS        |                |                |                |                |                |                |                |                |
|----------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|
|          |                | subjects       |                |                | files          |                | processes      |                | disk drives    |                |
|          |                | S <sub>1</sub> | S <sub>2</sub> | S <sub>3</sub> | F <sub>1</sub> | F <sub>1</sub> | P <sub>1</sub> | P <sub>2</sub> | D <sub>1</sub> | D <sub>2</sub> |
| SUBJECTS | S <sub>1</sub> | control        | owner          | owner control  | read *         | read owner     | wakeup         | wakeup         | seek           | owner          |
|          | S <sub>2</sub> |                | control        |                | write *        | execute        |                |                | owner          | seek *         |
|          | S <sub>3</sub> |                |                | control        |                | write          | stop           |                |                |                |

\* - copy flag set

# Access Control Models: DAC

- DAC model enforces access control based on user identities, object ownership and permission delegation. The owner of an object may delegate the permission of the object to another user.

# DAC Pattern Structure

- **Subject** represents a process acting on behalf of a user in a computer-based system. It could also be another computer system, a node or a set of attributes.
- **Permission** represents an authorization to carry out an action on the system. In general, Access Control Lists (ACLs) are used to describe DAC policies for its ease in reviewing. An ACL shows permissions in terms of objects, users and access rights.
- **ReferenceMonitor** checks permission for an access request based on DAC policies. If the user has permission to the object, the requested operation may be performed.

# Access Control Entries and Lists

- An **Access Control List** (ACL) for a resource (e.g., a file or folder) is a sorted list of zero or more **Access Control Entries** (ACEs)
- An ACE refers to specifies that a certain set of accesses (e.g., read, execute and write) to the resources is allowed or denied for a user or group
- Examples of ACEs for folder "Bob's CS547 Grades"
  - Bob; Read; Allow
  - TAs; Read; Allow
  - Bob; Write; Deny
  - TAs; Write; Allow

# Access Control Function

## Access Control System Commands

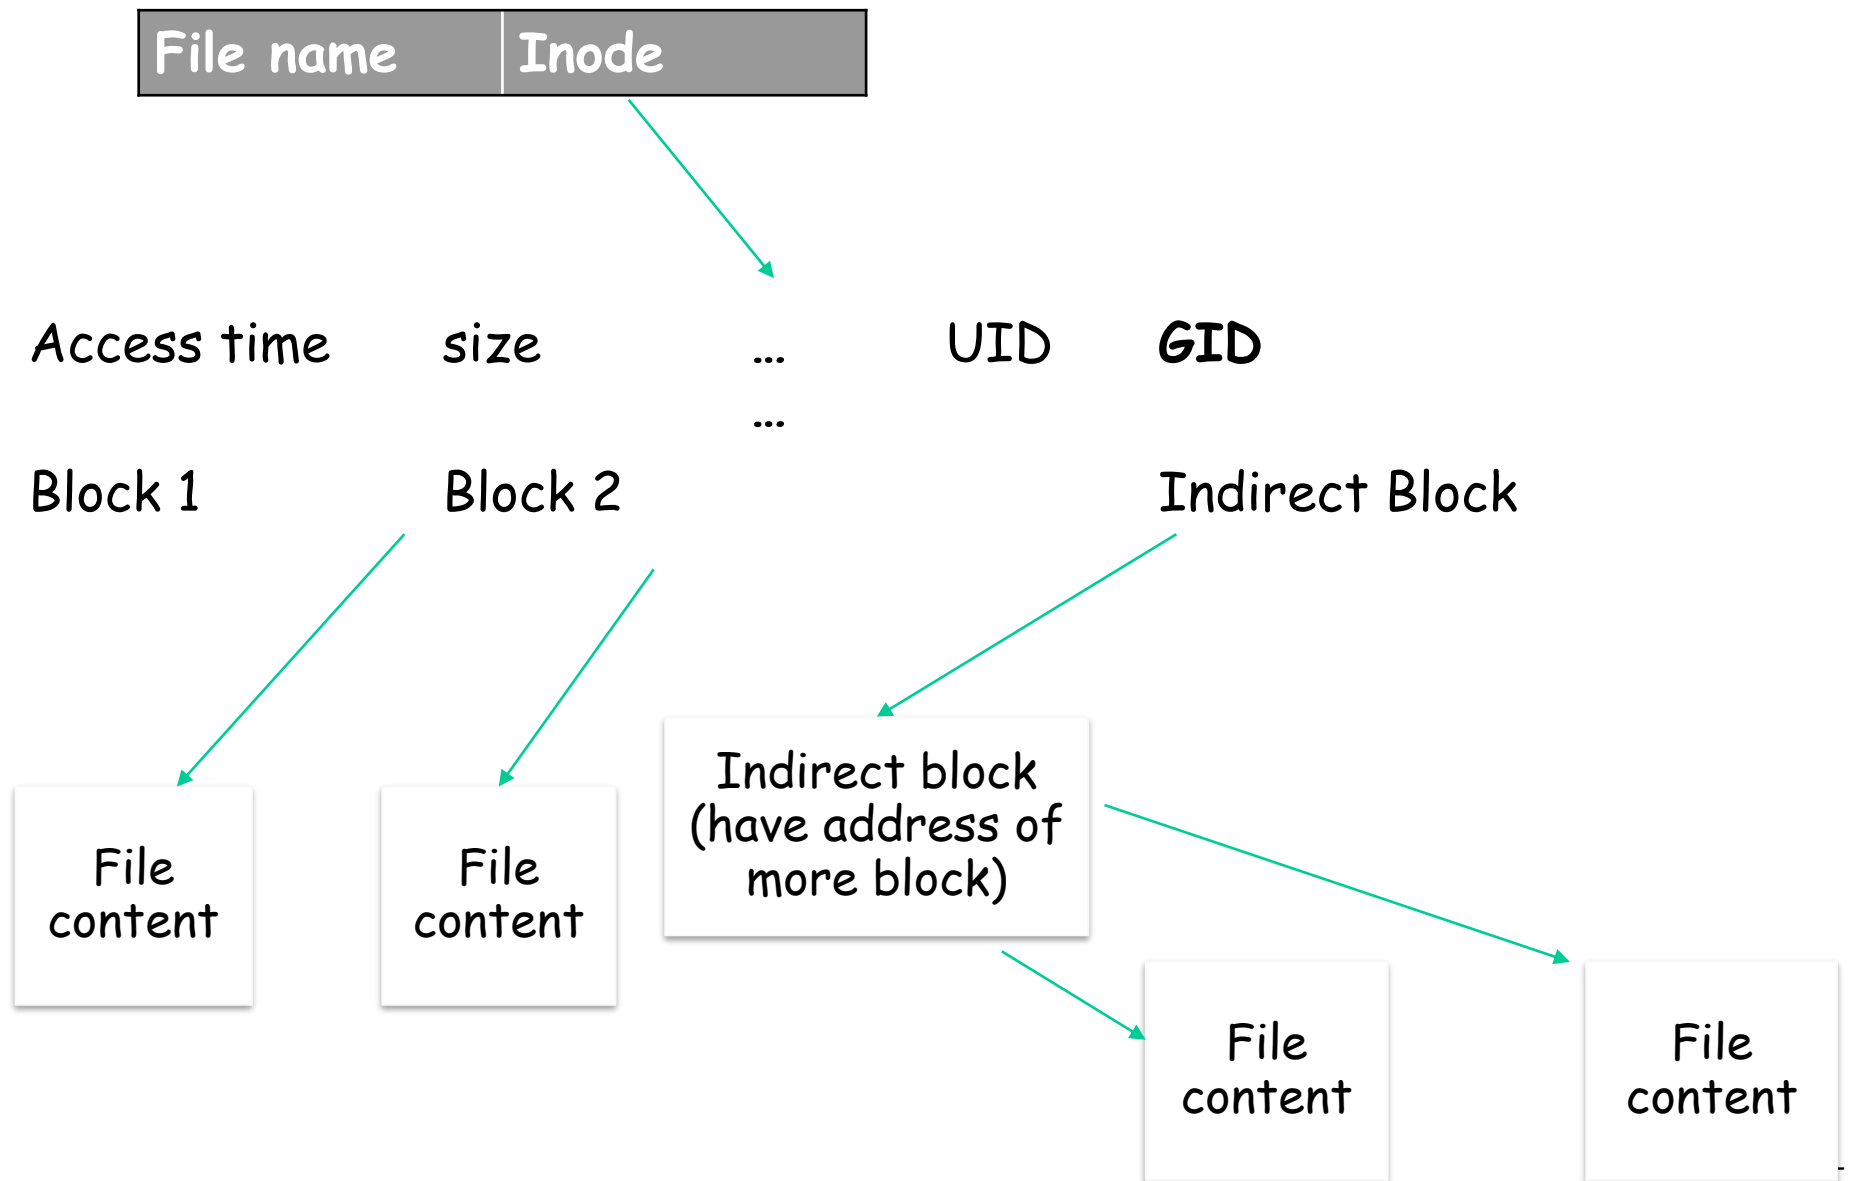

| Rule | Command (by $S_o$ )  | Authorization  | Operation  |
|------|--|--|--|
| R1   | <b>transfer</b> $\left\{ \begin{matrix} \alpha^* \\ \alpha \end{matrix} \right\}$ <b>to</b> $S, X$ | ' $\alpha^*$ ' in $A[S_o, X]$                            | store $\left\{ \begin{matrix} \alpha^* \\ \alpha \end{matrix} \right\}$ in $A[S, X]$           |
| R2   | <b>grant</b> $\left\{ \begin{matrix} \alpha^* \\ \alpha \end{matrix} \right\}$ <b>to</b> $S, X$    | 'owner' in $A[S_o, X]$                                   | store $\left\{ \begin{matrix} \alpha^* \\ \alpha \end{matrix} \right\}$ in $A[S, X]$           |
| R3   | <b>delete</b> $\alpha$ <b>from</b> $S, X$  | 'control' in $A[S_o, S]$<br>or<br>'owner' in $A[S_o, X]$ | delete $\alpha$ from $A[S, X]$   |
| R4   | $w \leftarrow$ <b>read</b> $S, X$  | 'control' in $A[S_o, S]$<br>or<br>'owner' in $A[S_o, X]$ | copy $A[S, X]$ into $w$  |
| R5   | <b>create object</b> $X$   | None   | add column for $X$ to $A$ ;<br>store 'owner' in $A[S_o, X]$                                    |
| R6   | <b>destroy object</b> $X$  | 'owner' in $A[S_o, X]$                                   | delete column for $X$ from $A$   |
| R7   | <b>create subject</b> $S$  | none   | add row for $S$ to $A$ ;<br>execute <b>create object</b> $S$ ;<br>store 'control' in $A[S, S]$ |
| R8   | <b>destroy subject</b> $S$   | 'owner' in $A[S_o, S]$                                   | delete row for $S$ from $A$ ;<br>execute <b>destroy object</b> $S$                             |

# Linux File Access Control

- File Access Control for:
  - Files
  - Directories
  - Therefore...
    - `\dev\` : *devices*
    - `\mnt\` : *mounted file systems*
    - What else? *Sockets, pipes, symbolic links...*

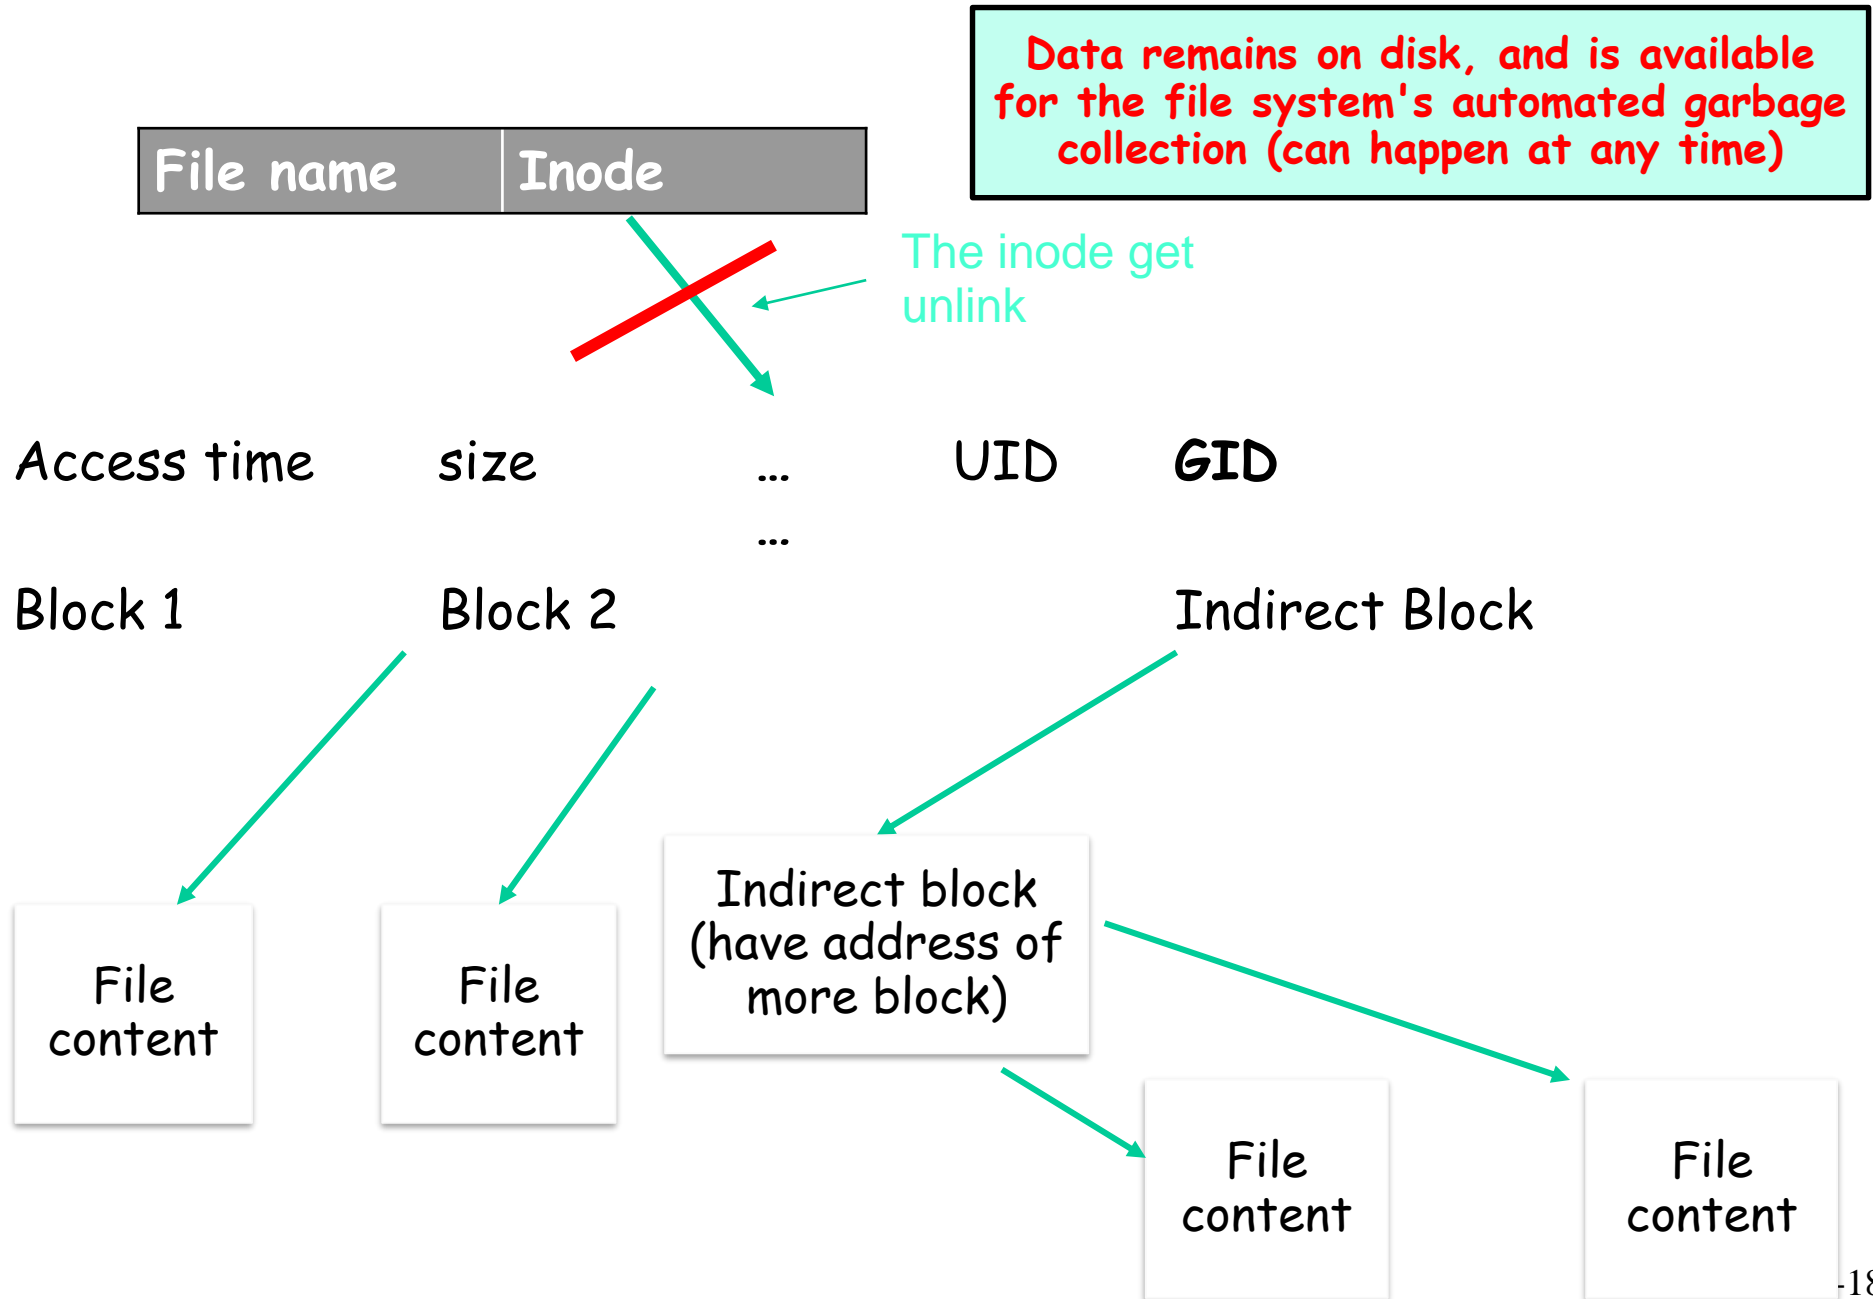

Because of the way devices and mounted file systems are represented in Linux as part of the file system, they are also covered by the same access control scheme as normal files.

# Linux File system architecture

# General delete behaviour

# Delete behaviour

- When we delete a file the only Inode link will break i.e. during deletion Data gets left on the disk, and the inode is just unlinked.
- That's how data recovery software work, because content are not deleted only pointer's are unlinked.

# Managing File and Directory Permissions

- Mode: Inode Section that stores permissions
- Three sections, based on the user(s) that receive the permission:
  - User permissions: Owner
  - Group permissions: Group owner
  - Other permissions: Everyone on system
- Three regular permissions may be assigned to each user:
  - Read
  - Write
  - Execute

# Interpreting the Mode

- rwX rwX rwX

Read, write, and execute permissions for all other users.

Read, write, and execute permissions for the group owner of the file.

Read, write, and execute permissions for the file owner.

File type:  
- indicates regular file  
d indicates directory

# Permissions Examples (Regular Files)

|            |  |
|------------|--|
| -rw-r—r--  | read/write for owner, read-only for everyone else              |
| -rw-r----- | read/write for owner, read-only for group, forbidden to others |
| -rwx-----  | read/write/execute for owner, forbidden to everyone else       |
| -r--r--r-- | read-only to everyone, including owner                         |
| -rwxrwxrwx | read/write/execute to everyone                                 |

# Permissions Examples (Directories)

|                         |  |
|-------------------------|--|
| <code>drwxr-xr-x</code> | all can enter and list the directory, only owner can add/delete files                    |
| <code>drwxrwx---</code> | full access to owner and group, forbidden to others                                      |
| <code>drwx--x---</code> | full access to owner, group can access known filenames in directory, forbidden to others |
| <code>-rwxrwxrwx</code> | full access to everyone  |

# Changing permissions

- `chmod` (change mode) command: Change mode (permissions) of files or directories
- Permissions stored in a file's or a directory's inode.

# Special permissions

- SUID (Set User ID)
- SGID (Set Group ID)
- Sticky Bit

Special with regular permission

Thanks
